Empower containerised app development and deployment, with powerful automation capabilities

With increased adoption accelerating demand for businesses to be able to roll out and manage containerised deployments across multiple departments, organisations need a strong foundation to build on.

App innovation needs to be able to happen anywhere, without restriction. Not only is it essential for DevOps teams to have the tools they need to build and deploy with confidence, but it's also vital that they do so with reduced complexity and risk.

Automating processes once helps your developers, architects and operation teams to execute repeatable tasks in a consistent environment. It's this automation that accelerates new opportunities and opens up space for growth and enriched end user experiences.

In September 2022, Dell Technologies and Red Hat announced an extension to their strategic partnership to accelerate opportunities for DevOps and containerised app development.

With Dell PowerFlex, Red Hat® Ansible® Automation Platform and Red Hat OpenShift®, you can automate the essential processes that support app innovation and deployment at scale. IT operations teams can gain greater control, visibility and management of the end-to-end processes that are essential for deploying, managing, and building quickly and securely. Plus developers only need to automate once before they can then run apps anywhere, anytime.

Automate your infrastructure for success today
Isn't it time you explored the opportunities that transformative automation from Dell Technologies and Red Hat can provide?

Take your first step towards tomorrow today:

· Contact your Dell Technologies or Red Hat representative.

· See what you can accomplish with Red Hat OpenShift.

· Discover how Dell PowerFlex can help you realise transformational change.

Dell Technologies
The powerful foundations critical to success

- Gain simplified flexibility to increase performance and productivity.

- Manage on your terms and scale on demand without complexity.

- Build resilience and protection in private and hybrid cloud environments.

Red Hat
The automation solution that supports your ambitions and growth

- Enterprise-ready enhancements to Kubernetes, enabling open source development and increased collaboration, which fosters innovation.

- Manage your entire development lifecycle, including standardised workflows with support for multiple environments.

- A single, consistent user experience for developers with the freedom to quickly build and deploy apps anywhere using the tools they want.
